Why is my Toyota Solara not starting?

Here are the most common reasons why the Toyota Solara won't start when the engine is not cranking. 1. Battery Cables If you have a battery post that looks like this, it may be keeping your Solara from starting. Start by taking a look at the battery posts.

Why does my Solara crank but not start?

If your Solara isn't getting enough fuel, or any fuel at all, it may have a bad fuel filter or a bad fuel pump. Without the proper amount of fuel entering the combustion chamber, the Solara will crank but not start. 2. Ignition Issues One of the most significant issues that will cause a vehicle to crank but not start are ignition issues.

Why is my Solara battery not working?

If the battery is in the vehicle and it's under 12 volts, it's likely bad unless your car has been sitting for a while or something is drawing current. If the battery is dead, it either isn't storing enough voltage or it isn't charging enough. A bad alternator can cause your battery to drain to the point it can't turn your Solara over.

Does a 2006 Solara have a timing belt?

When it does try to turn over I should say Timing belt is my guess, too. I believe the 2006 Solara uses either a 3MZ-FE V6 with a timing belt, or a 2AZ-FE, with a timing chain. The 3.3 3MZ-FE is apparently an interference engine. A compression test would quickly yield very useful information.

How do I know if my Solara battery is bad?

Start by taking a look at the battery posts. If they are loose or corroded, it acts as a barrier that can keep the starter from getting the voltage it needs to crank the engine. If there appears to be green or white on them or the terminals, cleaning them may be what your Solara needs to get back on the road.

How many volts does a Solara battery need to start?

Your Solara needs 12+ volts to start its engine. You can take your battery to the local parts store or even Walmart and have it tested to see if it still holds a charge. Alternatively, you can test the battery yourself with a voltage meter.
