SOLAR PRO. Concentrated solar thermal power plus molten salt storage

What is molten salts thermal energy storage?

Learn more. Molten salts (MSs) thermal energy storage (TES) enables dispatchable solar energy in concentrated solar power (CSP) solar tower plants. CSP plants with TES can store excess thermal energy during periods of high solar radiation and release it when sunlight is unavailable, such as during cloudy periods or at night.

Can molten salt thermal energy storage improve the reliability of electricity grid?

The steam is then used to power a turbine that generates energy. Concentrated solar power, when used in conjunction with other sources of energy, can help to improve the reliability of the electricity grid. The aim of this paper is to Design a CSP plant with molten salt thermal energy storage. A 70 MW CSP plant is designed with parabolic collector.

Can molten salt energy storage reduce wind and Solar Energy Curtailment?

The use of molten salt energy storage in conjunction with a cogeneration unit for peak shaving can effectively reduce the incidence of wind and solar energy curtailment. The multi-steam source energy storage mode is proposed based on the heat transfer characteristics of molten salt.

Does molten salt storage increase CSP generation?

A 70 MW CSP plant is designed with parabolic collector. MATLAB is software used for simulation of plant. The results of model shows that the overall generation of system 70 MW when adding molten salt storage, it increases efficiency of system and provide additional power 2 MW to grid. CSP generation increased with molten salt storage.

How molten salts are used in solar power plants?

Most of the operational plants have integrated a storage unitusing molten salts as the storage media, one uses combined steam/oil (Dahan Power Plant), another just steam (Khi Solar One) and one a ceramic heat sink (Jü lich Solar Tower).

What is molten salt technology?

The two-tank molten salt configuration is the preferred storage technology, especially in parabolic trough and solar tower. By 2020, the plants without storage will be just 30% of the total installed capacity. Molten salt technology will be used in the 67% of the plants, followed by concrete, steam and packed bed.
