

How does solar power work?

Through the use of solar power, the planet has an endless supply of renewable energy, at least as long as the sun exists. Solar power collects energy from the sun using solar panels and converts that solar energy into electricity.

Where does solar power come from?

The majority of the world's solar power comes from solar photovoltaics (solar panels). As of 2022, China holds more than 37 percent of the global installed capacity of installed photovoltaic capacity, dominating the solar industry.

What is solar energy?

Solar energy is radiation from the sun capable of producing heat, causing chemical reactions, or generating electricity. The total amount of solar energy incident on Earth is vastly in excess of the world's current and anticipated energy requirements.

How is solar energy used?

Solar power is used in two main ways: generating electricity or thermal energy. For most homeowners, solar panels that convert solar energy to electricity are the best use of solar energy because it allows them to save on electric bills.

Why is solar energy classified as renewable?

Solar energy is classified as renewable because it is derived from the sun, which, for all practical purposes on Earth, is an inexhaustible source of energy. The sun has been producing energy for about 5 billion years through nuclear fusion reactions in its core, and it is expected to continue doing so for several billion more years.

What is the primary source of energy for solar power?
