

How does a solar power bank work?

The photovoltaic cells generate a flow of electrons using the collected solar energy, resulting in an electric current. This current is then regulated and used to charge the power bank's battery. The final phase is using this stored electricity to charge your devices. All you need to do is plug in your device using a USB cable.

Can a portable solar power bank save energy?

Unless you plan on installing a solar energy system for your entire house, then you will not be saving an exponential amount of energy by using a portable solar power bank. While all electrical devices use up some amount of energy, smaller devices like phones and tablets use less than powering all of the energy eating appliances in our homes.

How does a power bank work?
