

Does an inverted block rate deliver benefits to the poor?

On the one hand, the use of an inverted block rate will deliver benefits primarily to the poor only in those instances where the poor have lower consumption than do the non-poor. On the other hand, if the poor do have lower consumption, they are likely to receive a proportion of benefits lower than their proportion in the overall population.

What is the difference between inverted block rates and lifeline rates?

(Note: inverted block rates and Lifeline rates are used as interchangeable terms throughout this report, unless the context clearly indicates otherwise.) Lifeline rate: A rate structure under which an initial block of consumption is priced lower than subsequent and higher blocks of consumption.

How safe is catheter ablation of superoparaseptal APS?

Safe and successful catheter ablation of superoparaseptal (previously called anterior septal) and midseptal accessory pathways (APs)--those for which ablation poses the highest risk of damaging the normal conduction system--requires a thorough knowledge of anatomy and relationships between structures.

How does an inverted block rate structure affect energy consumption?

An inverted block rate structure sends a strong conservation price signal to large consumers.⁵⁹ One asserted impact of the Lifeline rate is that increasing the rates in the higher consumption blocks will "increase incentives to conserve energy, even though the initial block's prices will be reduced."⁶⁰

Can AP conduction be ablated without collateral atrioventricular damage?

In this study, AP conduction was successfully ablated with lower energy (most patients at 10-30 W) at the right para-Hisian region and without collateral atrioventricular conduction damage in 48 patients.

Can AP ablation be assessed during ventricular pacing (SVT)?

However, AP ablation success cannot be assessed until ventricular pacing is performed after cessation of RF delivery. Ablation during SVT allows monitoring of both normal conduction and ablation success (SVT terminates retrogradely once the AP is eliminated).
