

Do Focusrite mics need Phantom Power?

The Focusrite CM25 microphones from the Scarlett and iTrack Studio are condensers and will need phantom power. The Vocaster DM1 and DM14v are dynamic mics so they do not require phantom power. Applies to all Focusrite preamps and interfaces 48V phantom power is 48 volts of electricity supplied through an audio cable that can...

How much power does a Focusrite Scarlett 2i2 use?

The Focusrite Scarlett 2i2 audio interface provides 48v of phantom power as an option for both microphone inputs.

Does Focusrite control retain 48V?

Starting in Focusrite Control 3.6.0 we have added the ability to "Retain 48V" for all 3rd Gen Scarletts. When the " Retain 48V " setting is set to Enable the 48V button will retain its last used setting. For example, if the 48V button on the interface is set to On, it will remain on after restarting the interface.

How do I enable 48V Phantom Power?

48v lights green to show it's enabled. 48V phantom power is now being sent to the XLR input on your Scarlett and to any device connected to the XLR input. To enable 48V (Phantom Power) from Focusrite Control 2 click the +48V button for the input you want to enable it on. This is the same as pressing the 48V button on the Scarlett Solo hardware.

How does 48V Phantom Power work?

On Focusrite preamps and interfaces, when you turn the 48V button on, phantom power is sent to the XLR mic inputs that the button controls. 48V phantom power is not sent to any 6.35 mm (1/4") jack inputs or other inputs; these are instrument or line inputs. Can 48V phantom power damage my equipment?

What is phantom power used for?

Phantom power is necessary to use some external equipment such as inline preamps and to activate and use a condenser microphone. The Focusrite Scarlett 2i2 audio interface provides 48v as an option for both microphone inputs.
