How does solar power work?

The process of solar power is explained beginning with solar panels. These panels are typically installed on rooftops to capture the maximum sunlight. Each panel is made up of solar cells,which are composed of semiconducting materials like silicon. When sunlight hits these cells, it excites the electrons, creating an electric current.

How do solar panels generate electricity?

Solar panels generate electricity by absorbing sunlight with solar cells. They use this sunlight to create direct current (DC) electricity through a process called 'the photovoltaic effect'.

How do solar panels convert sunlight into electricity?

The most common method uses photovoltaic (PV) panels that convert sunlight directly into electricity through a process called the photovoltaic effect. When sunlight hits a PV cell, it's not simply absorbed as heat. Instead, the energy from the sunlight disrupts the arrangement of electrons within the silicon, creating an electric field.

What is a solar cell & how does it work?

A solar cell: Also known as a photovoltaic (PV) cell, is a remarkable device that captures sunlight and directly converts it into electricity. Made from semiconductor materials like silicon, these cells use the power of light particles to generate electrical current, offering a clean and sustainable energy source.

How does sunlight generate electricity?

Sunlight dislodges electrons, pushing them towards the positive side, generating a flow of electricity--direct current (DC). This is the essence of the photovoltaic effect, the scientific principle behind solar power generation. The electricity generated by a single PV cell is minimal.

How is solar energy produced?

Solar energy is produced when photons, which are waves and particles created in the sun's core, reach Earth's surface and are absorbed by solar panels.
