What is integrated solar combined cycle power plant (ISCC)?

Introduction The Integrated Solar Combined Cycle Power Plant (ISCC) has been introduced in the power generation sector as a technology with the potential to help reduce the costs of solar energy for electricity generation. An ISCC power plant combines a Concentrated Solar Power (CSP) plant and a Natural Gas-Fired Combined Cycle (NGCC) power plant.

What is a combined cycle power plant?

The combined cycle power plant is a flexible concept and it can be adapted in various ways to accommodate different sources of energy. One of the most interesting of these is the integrated solar combined cycle (ISCC) power plant.

What is integrated solar combined cycle?

Integrated solar combined cycle. It consists in supplying solar steam to the steam cycle and correspondently saving some gas consumption for the same power.

What is a hybrid-nuclear/integrated solar combined-cycle (ISCC) power station?

The Hybrid-Nuclear/Integrated Solar Combined-Cycle (ISCC) power station can provide peaking power with exceptionally low emissions at costs well below those of conventional gas turbines and solar power plants.

What is an ISCC power plant?

An ISCC power plant combines a Concentrated Solar Power (CSP) plant and a Natural Gas-Fired Combined Cycle (NGCC) power plant. The CSP energy is used to either produce additional steam for use in the NGCC's steam turbine to generate electricity, or to heat the compressed air in the gas turbine before entering the combustion chamber.

Can solar-based combined cycle power plant be retrofitted with NGCC?

This study will be beneficial to the power plant professionals intending to modify the solar-based Combined Cycle Power Plant (CCPP) and to retrofit the existing Natural Gas Combined Cycle (NGCC) plant with the advanced solar cycle.
