

What are invt drive fault codes & eth2 fault codes?

invt drive fault codes list - if you are facing any fault in INVT drive then these fault codes list will help you to identify cause and its solution. ETH2 - Grounding shortcut fault 2: This means an ground fault overcurrent flows due to an earth fault that occurred on the inverter's output side (load side).

What does ll fault mean in inverter?

This means an ground fault overcurrent flows due to an earth fault that occurred on the inverter's output side (load side). LL fault in INVT drive indicates Electronic underload fault. This means the inverter will report the underload pre-alarm according to the set value. PoFF fault indicate that the indicates input voltage is too low.

What is OL2 fault in inverter drive?

OL2 fault in INVT drive indicates Inverter overload. This means the output current has exceeded due to load too heavy or acceleration too fast. OL3 fault in INVT drive indicates Electrical overload. This means the inverter will report overload pre-alarm according to the set value. SPI fault in INVT drive indicates Input phase loss.

What is eth2 fault in inverter?

ETH2 fault in INVT drive indicates Grounding shortcut fault 2. This means an ground fault overcurrent flows due to an earth fault that occurred on the inverter's output side (load side). LL fault in INVT drive indicates Electronic underload fault. This means the inverter will report the underload pre-alarm according to the set value.

What is OV1 fault in inverter?

OV1 fault in INVT drive indicates Over Voltage when Acceleration. This means the inverter's internal main circuit DC voltage to reach or exceed the specified value. OV2 fault in INVT drive indicates Over voltage when deceleration. This means the drive internal main circuit DC voltage to reach or exceed the specified value.

What is OC2 fault in inverter drive?

OC2 fault in INVT drive indicates Over current in Deceleration. This means the deceleration time too short, large load inertia or inverter power rating too small. OC3 fault in INVT drive indicates Overcurrent when constant speed running. This means the abrupt fluctuations in the load or abnormal load conditions.
