

What is OC1 fault in a frequency inverter?

Fault Name:OC1 fault occurs during the frequency inverter's operation.Fault explanation: The OC fault is a sudden change in current detectionduring frequency inverter operation. In order to prevent it from being damaged by an excessive current,the frequency inverter internally collects the current signal and protects itself.

What is an OC1 error in an inverter?

An OC1 error in an inverter indicates an overcurrent condition during acceleration. This means the motor connected to the inverter is drawing more current than the inverter is rated for during the start-up phase. Here's a breakdown of the issue and some troubleshooting steps: Possible Causes of OC1 Error:

What is OC3 and OV1 fault in inverter?

OC3 fault in INVT drive indicates Overcurrent when constant speed running. This means the abrupt fluctuations in the load or abnormal load conditions. OV1 fault in INVT drive indicates Over Voltage when Acceleration. This means the inverter's internal main circuit DC voltage to reach or exceed the specified value.

What is OC2 fault in inverter drive?

OC2 fault in INVT drive indicates Over current in Deceleration. This means the deceleration time too short,large load inertia or inverter power rating too small. OC3 fault in INVT drive indicates Overcurrent when constant speed running. This means the abrupt fluctuations in the load or abnormal load conditions.

What is OL1 fault in inverter drive?

OL1 fault in INVT drive indicates Motor overload. This means the output current exceeds the motor full load current set in parameter. OL2 fault in INVT drive indicates Inverter overload. This means the output current has exceeded due to load too heavy or acceleration too fast. OL3 fault in INVT drive indicates Electrical overload.

Why is my frequency inverter OC1 not working?

When the customer repeatedly starts the frequency inverter and it reports OC1 every time and it cannot be used either. The reason for the OC failure is nothing but the on-site cause of the damage of the frequency inverter's components itself. Caused by the scene,so we need to solve it by troubleshooting on-site.

o The inverter may start up by itself when P01.21=1. Do not get close to the inverter and motor. o The inverter cannot be used as "Emergency-stop device". o The inverter cannot be used to break the motor suddenly. A mechanical braking device should be provided.

4. Select an inverter with bigger reverse direction of the code power. panel and long low-speed 5. Select a proper motor. operation The inverter wi report overload Check the ...

OH Over heating inside the panel, the inverter is too hot. check ventilation. OC1 The drive is overloaded. The motor current exceeds the Inverter rating by 210% Check motor connections and for mechanical obstructions. OC2 The motor current has exceeded the inverter rating by 150% for more than 30 seconds. Check for mechanical obstructions.

Q3: The keypad display OL2 or OC1 code when start? A: 1. Please change the ACC time P00.11=5.0 seconds, test it again. 2. If the pump is single phase, remove the capacitors as the Q2. 3. If the pump running ...

An oC (Overcurrent) fault will occur when the output current exceeds the overcurrent detection level, which is approximately 180% to 200% (varies between model numbers) of the drive rated current. The possible causes are listed below: The load is too heavy. The drive capacity is too small for the motor. The acceleration or deceleration times are too short.

An oC (Overcurrent) fault will occur when the output current exceeds the overcurrent detection level, which is approximately 180% to 200% (varies between model ...

SPC Series Solar Pump Inverter Safety precautions -2- 1.3 Safety guidelines Only trained and qualified professionals are allowed to carry out related operations. Do not perform wiring, inspection or component replacement when power supply is applied. Ensure all the input power supplies have been

invt drive fault codes list - if you are facing any fault in INVT drive then these fault codes list will help you to identify cause and its solution.

The inverter may automatically start when P01.21=1. Do not get close to the inverter and motor. The inverter cannot be used as an "Emergency-stop device". Note: Do not switch on/off the input power supply of the inverter frequently. For inverters that have been stored for a long time, check it, adjust the capacitance and

z The inverter input voltage does not exceed the maximum input voltage; otherwise inverter damage may occur. z The positive and negative pole of solar modules can not be grounded, otherwise irrecoverable damage may occur. z Ensure the proper grounding of the inverter, otherwise, improper connection or no grounding may cause stop of the inverter.

OC1 fault in INVT drive indicates Over current in Acceleration. This means the over current during Acceleration . This fault appears when the motor is drawing excess current ...

FR-E700 is a new generation Mitsubishi inverter line with all the basic features like the FR-D700 series,

however it is improved to save more energy and has a more compact size, with a higher price. It is normal for an inverter to report ...

The meaning of OC1 is over current during Acceleration. This fault appears when the motor is drawing excess current during acceleration. Main probable causes of the fault: 1 ...

+ Power board fault in the driver circuit. + Control board malfunction. + IGBT module is damaged. + Improper grounding. + Motor malfunction (very rare). + VFD experiences a sudden power loss. - Test and check IGBT. - ...

The meaning of OC1 is over current during Acceleration. This fault appears when the motor is drawing excess current during acceleration. Main probable causes of the fault: 1 The acceleration time ACC is too short. 2 The parameter Pt(Motor Control Mode) is incorrect. 3 The drive is starting into a rotating load. ...

inverter, we suggest disassembling the module firstly, and then check the power supply of drive board is normal or not. If repairing the inverter in site, we suggest replacing the drive board and the module. For inverters of 18.5kW and above, as the rectifier bridge, the inverter module and the power supply of drive board are
