

How did the solar eclipse affect energy use?

During the August 2017 eclipse, the loss of renewable power generation added up to nearly 6 gigawatts. That's equivalent to the energy usage of 600 million LED lightbulbs or 4.5 million homes. Grid operators compensated by planning ahead and increasing power generation at natural gas and coal-powered plants, which don't depend on sunlight.

Will a total solar eclipse affect power generation?

On April 8, 2024, another total solar eclipse will track across the U.S., causing perhaps an even greater loss of solar power generation. Although this will be the second total solar eclipse visible in the U.S. in under seven years, these events are a rare occurrence. Nevertheless, they present a unique challenge to power grid operators.

Will solar power be a major energy source during the 2017 eclipse?

During the 2017 eclipse, solar generation was the fifth-leading energy source in the United States behind natural gas, coal, nuclear, and hydroelectric. Even with the eclipse, we still expect solar generation to be the third-largest contributor of electricity in the United States on April 8, behind natural gas and nuclear.

How will solar power change during the solar eclipse?

Several grid authorities have released plans for how they plan to deal with the change in solar generation during the eclipse. During the eclipse, electricity generators in the affected areas will have to increase output from other sources of electricity generation to supplement the decrease in solar power.

Will solar power be affected by the solar eclipse?

All 50 states will experience some degree of disruption to solar power generation during the solar eclipse, according to the National Renewable Energy Laboratory (NREL).

How does a solar eclipse work?

"An eclipse is a bit of a drastic example of what the ISO manages on a day-to-day basis, balancing the demand for electricity and the supply," says spokesperson Mary Colapietro. The exact response--using extra power from batteries, pumped hydropower, or natural gas--will depend on the day's energy market.
