

What is solar energy self-consumption?

Solar energy self-consumption involves using the electricity produced by one's own solar panels at the moment of its production. This helps reduce dependence on the traditional electrical grid and, consequently, achieve significant savings on electricity bills. There are three main types of self-consumption: random, optimized, and with storage.

What is solar self-consumption?

Solar self-consumption refers to the practice of using photovoltaic (PV) renewable energy for a building's own electrical needs. In this model, the PV-generated energy is consumed instantaneously as it is being produced, making the building both a producer and consumer, or 'prosumer'.

Is self-consumption necessary for solar panels?

While self-consumption isn't necessary for everyone with solar panels on their property, it's key to maximizing your savings without one-to-one net metering, which exists (or will exist in the future) in many places.

How can I increase my solar self-consumption?

One important way to increase your own solar self-consumption is to pair your solar panel system with a home battery setup. Additionally, turning off appliances and lights at night when your panels aren't producing electricity will reduce the amount of electricity you'll need to pull from the grid.

What are the advantages of self-consumption solar?

Self-consumption solar offers several benefits, including efficient use of generated power, minimizing wastage, and enhancing sustainability. This approach supports long-term energy savings and environmental benefits. You do not need to go off grid to use the solar produced electricity.

What is the solar self-consumption ratio?

The solar self-consumption ratio is the ratio between the PV production and the portion of the PV production consumed by the loads. This ratio can be a value between 0% and 100%, with 100% solar self-consumption meaning that all produced PV energy is consumed by the loads.

The graph below shows an estimate of the solar self-consumption for a household with annual electricity consumption in the range 3,000 to 3,499 kWh and annual solar PV generation between 2,700 and 2,999 kWh. Adding a ...
