

How stable are sola power conditioners?

Sola power conditioners are very stable with respect to temperature, with a change in output voltage of only 0.025% per degree centigrade. Units are factory adjusted to +2%/-0% of nominal with full load and nominal input voltage.

Do Sola power conditioners regulate power factor load?

Sola power conditioners regulate power factor loads. The output voltage depends on the load current and load power factor (see Figure 6). If lower voltage under lagging power factor is objectionable, correction can be made with capacitors at the load.

Are Sola power conditioners maintenance free?

With no moving parts, SolaHD ferroresonant power conditioners are virtually maintenance free. In 1938, Sola was awarded the first patent for a ferroresonant power conditioner; the constant voltage transformer. Since then, Sola has remained at the forefront of ferroresonant power conditioning.

What is the maximum temperature rise of a Sola power conditioner?

The normal maximum temperature rise of a Sola power conditioner may fall anywhere in the range of 40°C to 110°C depending on the type and rating. The nominal design ambient range is between -20°C and +50°C (-20°C to +40°C for 70 - 1000 VA, 60 Hz portable models). In almost all applications, this effect may be disregarded.

Why does a Sola ferroresonant power conditioner have harmonic free output?

A Sola ferroresonant power conditioner provides harmonic-free output due to the addition of a neutralizing coil. This coil neutralizes the harmonics in a manner best explained by first considering the device as a conventional transformer with the neutralizing coil disconnected.

Why should you choose Sola MCR hardwired?

The MCR is a perfect choice where dirty power, caused by impulses, swell, sags, brownouts and waveform distortion can lead to costly downtime because of damaged equipment. The Sola MCR Hardwired Series provides excellent noise filtering and surge suppression to protect connected equipment from damage, degradation or misoperation.

These power conditioner units hold output voltage regulation to a maximum of ±5%, even with an input voltage window of +15% to -25%. Response time to any line variation is 1.5 cycles regardless of power factor. The power ...

Sola's ferroresonant power conditioners protect equipment from all power problems other than a complete loss of power. They excel at tightly regulating voltage within ...
