

What is a solar pond?

A solar pond is an area of land to be covered with water and receives thermal energy by insolation. The depth of water is ranging from (1-1.5) m. The area of the pond is 1.49 or 1.2 km on a side. Convection heat transfer is prevented by salting the water by the addition of NaCl or MgCl₂ or NaHCO₃ in the lower 40-50cm depth of the pond.

How do solar ponds work?

Solar ponds, on the other hand, are designed to keep the warm water at the bottom from mixing with the cooler water at the top. This is achieved by making the bottom layer heavier with salt. This allows high temperatures of over 90°C to appear in the bottom layers. Commonly used salts like sodium chloride or magnesium chloride are used.

What is a solar pond power plant?

The solar pond power plant (SPPP) uses halo-carbons (like Freons) or hydrocarbons (such as propane) as the fluids. Tundee et al. (2013) reported significant potential for electric power generation from small solar ponds through a simple and passive device incorporating thermosyphons and thermoelectric cells.

Are solar pond power plants based on thermoelectric generators?

Traditionally, electricity generation from solar ponds has been based on Organic Rankine Cycle. In the last decade, the potential of solar pond power plants (SPPP) based on thermoelectric generators (TEGs) has been explored. A review of various studies in this direction is presented in this paper.

Can small solar ponds generate electricity?

Research results in the present work indicate that there is a significant potential for electric power generation from small solar ponds through a simple and passive device incorporating thermosyphons and thermoelectric cells. Dunn, P. D., and Reay, D. A. 1994. Heat Pipes, Pergamon, Fourth Edition.

How does a solar pond peaking plant work?

The heat storage capacity of the pond allows quick delivery of the stored energy when needed. Solar pond peaking plants can produce up to ten times as much power as their generated output power, an unheard of capability in thermal power technology. Since there is no boiler, they start up in just a few minutes.
