SOLAR PRO. Solar power basics

What are the basic components of a solar system?

A solar power system consists of four basic components: Solar Panels, which convert direct sunlight to electricity; Battery, to store the electricity for later use; Charge Controller, to regulate the charging process and prevent over-charging; and Inverter, which is optional if you want a 'wall plug' from your solar system.

What is solar power & how does it work?

Most of us understand what solar power is and how it generally works. Solar panels convert sunlight into electricity, which is then transmitted to a battery or directly to a load (an appliance, machine etc.). If you are planning to install a solar system or buy a solar generator, you must master the basics of electricity and power generation.

What do you need to know before installing a solar system?

If you are planning to install a solar system or buy a solar generator, you must master the basics of electricity and power generation. This means fully understanding what volts, amps, watts, and watt-hours are and how they relate to meeting your power generation needs.

What are the basics of solar energy technology?

Solar energy technology basicsinclude understanding solar radiation, photovoltaics (PV), concentrating solar-thermal power (CSP), grid integration, and soft costs.

How is solar energy used?

Solar power is used in two main ways: generating electricity or thermal energy. For most homeowners, solar panels that convert solar energy to electricity are the best use of solar energy because it allows them to save on electric bills.

What is solar energy?

Solar energy is energy from the sun that we capture with various technologies, including solar panels. There are two main types of solar energy: photovoltaic and thermal. The "photovoltaic effect" is the mechanism by which solar panels harness the sun's energy to generate electricity. Want to take advantage of solar energy yourself?
