

What is a solar water heater?

A solar water heater, also known as a solar domestic hot water system, is a cost-effective way to generate hot water for your home using sunshine as fuel. These systems include storage tanks and solar collectors, and can be used in any climate.

How do solar water heaters work?

Solar water heaters are a cost-effective way to heat a residential property's water supply with the power of the sun. Most solar water heaters harness the sun's thermal (or heat) energy by directly allowing sunlight to warm an outdoor water supply or by using special solar thermal energy collectors.

What are the main types of solar water heaters?

There are two main types of solar water heaters: passive systems and active systems. Passive systems rely on natural convection to move heated water, while active systems use pumps for circulation. Both systems can significantly reduce reliance on conventional energy sources for water heating.

Are solar water heaters a good idea?

Solar water heaters are an excellent way to heat water without using grid electricity or putting extra strain on your solar energy system. They also have the benefits of being simple to use, relatively low maintenance, and easy to install.

What can a solar water heater do for your pool?

Solar water heater systems come in a variety of shapes and sizes and can increase the value of your home. Some can extend the swimming season by heating your pool, while others can heat your shower to the perfect temperature. Whatever your needs and level of investment, there's a solar water heater system out there for you.

How do I choose a solar water heater?

There are two different options for choosing a solar water heater: an active or passive model. An active solar water heater uses a pump to circulate water through your home, while a passive model relies on thermodynamics. With passive systems, water moves naturally through convection as it heats up.
