

What is a solid waste container?

Solid waste does not necessarily mean solid material, but rather anything that can be discarded without causing harm to human health and the environment. The following containers are typically used to haul non-toxic waste, such as garbage, debris, scrap, ocean/lake water and recyclable materials.

What are the types of waste containers?

Types of Waste Containers Heavy industries such as construction and oil and gas produce large amounts of solid, liquid and gaseous waste, which could be hazardous. Demolition jobs and agricultural activities on the other hand produce non-hazardous waste. Choose the containers from the list below based on the application. Roll-off containers/boxes.

What types of containers are used to haul non-toxic waste?

The following containers are typically used to haul non-toxic waste, such as garbage, debris, scrap, ocean/lake water and recyclable materials. Rectangular containers can be found in different sizes and grades to best fit the hauler's needs.

What is a stationary container?

A stationary container is an immovable and fixed waste storage container. The waste stored in these containers is manually transferred by the waste collection crew, and they are emptied directly into the collection vehicle by mechanical means at certain times.

What are these containers used for?

These containers are used for special type of wastes (i.e.) when the wastes need separate treatment and processing. Hauled/movable containers: These types of containers are fixed with wheels to facilitate its movement to waste processing site, transfer station or directly to the disposal site.

How to select a waste collection container?

When choosing a waste collection container, consider the following factors: Size and weight - it should be of appropriate size to avoid occupational health hazards and should not weigh more than 20 kg. Additionally, the containers should be low cost and economical to minimize collection costs.
