

What is molten salt storage in concentrating solar power plants?

At the end of 2019 the worldwide power generation capacity from molten salt storage in concentrating solar power (CSP) plants was 21 GWh el. This article gives an overview of molten salt storage in CSP and new potential fields for decarbonization such as industrial processes, conventional power plants and electrical energy storage.

What is the first hybrid solar project in Spain?

SENER Renewable Investments, the SENER Group subsidiary that promotes and develops highly technological renewable energy projects, has launched the first hybrid solar project in Spain that merges CSP technology with molten salt storage and photovoltaic technology.

How do molten salt power plants work?

In molten salt power plants, the sunlight is reflected by mirrors (called heliostats) on to a tower that contains the molten salt. The radiated solar energy heats the salt to 1050 degrees F. The high temperature molten salt is pumped through heat exchangers to produce steam, that is then used to drive turbines for power production.

Can molten salt storage be used as a peaking power plant?

Drost proposed a coal fired peaking power plant using molten salt storage in 1990 [12]. Conventional power plant operation with a higher flexibility using TES was examined in research projects (e.g., BMWi funded projects FleGs 0327882 and FLEXI-TES 03ET7055).

Can molten salts be used in industrial applications?

In general, there is experience with molten salts in a number of industrial applications related to heat treatment, electrochemical treatment and heat transfer for decades. Example of a 1000 MWh two-tank molten salt storage system of a concentrating solar power plant in Spain (Source: Andasol 3).

How does molten salt work?

The high temperature molten salt is pumped through heat exchangers to produce steam, that is then used to drive turbines for power production. The storage of sun energy in molten salt acts as the buffer to continue production of solar power, when photovoltaic generation stops in the night time or reduces due to overcast skies.
